more advanced mathematical concepts. Below are the core topics covered in this unit:

Systems of Equations

One of the primary focuses of Unit 5 is on systems of equations. Students learn to solve systems both graphically and algebraically. Mastery of this topic includes understanding how to:

- Identify systems of linear equations.
- Use substitution and elimination methods to find solutions.
- Graph systems of equations to visualize solutions.

Learning how to interpret the solutions—whether they are one solution, no solution, or infinitely many solutions—is a key aspect of this topic.

Inequalities

Another critical area in Unit 5 is inequalities. Students explore how to solve and graph inequalities, including:

- Understanding the difference between linear equations and inequalities.
- Graphing linear inequalities on a coordinate plane.
- Solving multi-step inequalities.

Students also learn to express solutions in interval notation, which is an important skill for future mathematics courses.

Functions

This unit also covers the concept of functions, where students learn to distinguish between functions and non-functions. Key learning objectives include:

- Identifying function notation.
- Understanding domain and range.
- Evaluating functions for given inputs.

Grasping the concept of functions is essential for students as it lays the groundwork for higher-level topics in algebra and calculus.
