algebra 1 book free: *Algebra* Carl Faith, 2012-12-06 VI of Oregon lectures in 1962, Bass gave simplified proofs of a number of Morita Theorems, incorporating ideas of Chase and Schanuel. One of the Morita theorems characterizes when there is an equivalence of categories $\text{mod-}A \text{ R}::! \text{mod-}B$ for two rings A and B . Morita's solution organizes ideas so efficiently that the classical Wedderburn-Artin theorem is a simple consequence, and moreover, a similarity class $[A]$ in the Brauer group $\text{Br}(k)$ of Azumaya algebras over a commutative ring k consists of all algebras B such that the corresponding categories $\text{mod-}A$ and $\text{mod-}B$ consisting of k -linear morphisms are equivalent by a k -linear functor. (For fields, $\text{Br}(k)$ consists of similarity classes of simple central algebras, and for arbitrary commutative k , this is subsumed under the Azumaya [51]1 and Auslander-Goldman [60] Brauer group.) Numerous other instances of a wedding of ring theory and category (albeit a shot gun wedding!) are contained in the text. Furthermore, in my attempt to further simplify proofs, notably to eliminate the need for tensor products in Bass's exposition, I uncovered a vein of ideas and new theorems lying wholly within ring theory. This constitutes much of Chapter 4 -the Morita theorem is Theorem 4. 29-and the basis for it is a correspondence theorem for projective modules (Theorem 4. 7) suggested by the Morita context. As a by-product, this provides foundation for a rather complete theory of simple Noetherian rings-but more about this in the introduction.

algebra 1 book free: Advances in Two-Dimensional Homotopy and Combinatorial Group Theory Wolfgang Metzler, Stephan Rosebrock, 2017-11-16 This volume presents the current state of knowledge in all aspects of two-dimensional homotopy theory. Building on the foundations laid a quarter of a century ago in the volume Two-dimensional Homotopy and Combinatorial Group Theory (LMS 197), the editors here bring together much remarkable progress that has been obtained in the intervening years. And while the fundamental open questions, such as the Andrews–Curtis Conjecture and the Whitehead asphericity problem remain to be (fully) solved, this book will provide both students and experts with an overview of the state of the art and work in progress. Ample references are included to the LMS 197 volume, as well as a comprehensive bibliography bringing matters entirely up to date.

algebra 1 book free: Handbook of Algebra M. Hazewinkel, 2006-05-30 Algebra, as we know it today, consists of many different ideas, concepts and results. A reasonable estimate of the number of these different items would be somewhere between 50,000 and 200,000. Many of these have been named and many more could (and perhaps should) have a name or a convenient designation. Even the nonspecialist is likely to encounter most of these, either somewhere in the literature, disguised as a definition or a theorem or to hear about them and feel the need for more information. If this happens, one should be able to find enough information in this Handbook to judge if it is worthwhile to pursue the quest. In addition to the primary information given in the Handbook, there are references to relevant articles, books or lecture notes to help the reader. An excellent index has been included which is extensive and not limited to definitions, theorems etc. The Handbook of Algebra will publish articles as they are received and thus the reader will find in this third volume articles from twelve different sections. The advantages of this scheme are two-fold: accepted articles will be published quickly and the outline of the Handbook can be allowed to evolve as the various volumes are published. A particularly important function of the Handbook is to provide professional mathematicians working in an area other than their own with sufficient information on the topic in question if and when it is needed.- Thorough and practical source for information- Provides in-depth coverage of new topics in algebra- Includes references to relevant articles, books and lecture notes
