algebra in korean: *Polynomials and the mod 2 Steenrod Algebra: Volume 2, Representations of $GL(n, F_2)$* Grant Walker, Reginald M. W. Wood, 2017-11-09 This is the first book to link the mod 2 Steenrod algebra, a classical object of study in algebraic topology, with modular representations of matrix groups over the field F of two elements. The link is provided through a detailed study of Peterson's 'hit problem' concerning the action of the Steenrod algebra on polynomials, which remains unsolved except in special cases. The topics range from decompositions of integers as sums of 'powers of 2 minus 1', to Hopf algebras and the Steinberg representation of $GL(n, F)$. Volume 1 develops the structure of the Steenrod algebra from an algebraic viewpoint and can be used as a graduate-level textbook. Volume 2 broadens the discussion to include modular representations of matrix groups.

Taylor, Maurice Martin Taylor, 1995-01-01 Chinese, Japanese, South (and North) Koreans in East Asia have a long, intertwined and distinguished cultural history and have achieved, or are in the process of achieving, spectacular economic success. Together, these three peoples make up one quarter of the world population. They use a variety of unique and fascinating writing systems: logographic Chinese characters of ancient origin, as well as phonetic systems of syllabaries and alphabets. The book describes, often in comparison with English, how the Chinese, Korean and Japanese writing systems originated and developed; how each relates to its spoken language; how it is learned or taught; how it can be computerized; and how it relates to the past and present literacy, education, and culture of its users. Intimately familiar with the three East Asian cultures, Insup Taylor with the assistance of Martin Taylor, has written an accessible and highly readable book. Writing and Literacy in Chinese, Korean and Japanese is intended for academic readers (students in East Asian Studies, linguistics, education, psychology) as well as for the general public (parents, business, government). Readers of the book will learn about the interrelated cultural histories of China, Korea and Japan, but mainly about the various writing systems, some exotic, some familiar, some simple, some complex, but all fascinating.

algebra in korean: A Course in BE-algebras Sambasiva Rao Mukkamala, 2018-02-14 This

book presents a unified course in BE-algebras with a comprehensive introduction, general theoretical basis and several examples. It introduces the general theoretical basis of BE-algebras, adopting a credible style to offer students a conceptual understanding of the subject. BE-algebras are important tools for certain investigations in algebraic logic, because they can be considered as fragments of any propositional logic containing a logical connective implication and the constant 1, which is considered as the logical value "true". Primarily aimed at graduate and postgraduate students of mathematics, it also helps researchers and mathematicians to build a strong foundation in applied abstract algebra. Presenting insights into some of the abstract thinking that constitutes modern abstract algebra, it provides a transition from elementary topics to advanced topics in BE-algebras. With abundant examples and exercises arranged after each section, it offers readers a comprehensive, easy-to-follow introduction to this field.

algebra in korean: Differential Identities in Rings and Algebras and their Applications Shakir Ali, Mohammad Ashraf, Vincenzo De Filippis, Lahcen Oukhtite, Nadeem Ur Rehman, 2025-05-26 The theory of differential identities in associative rings and algebras is the basis of this monograph. Informally, an identical relation involving arbitrary elements in the underlying rings (or algebras) along with the unknown differential function is called a differential identity in a ring (or algebra). Invariant theory, non-commutative geometry, mathematical physics, and the theory of rings and algebras are just a few of the fields where this abstract theory has proved to be an effective instrument for solving a wide range of challenging issues, and as the twenty-first century has arrived, the theory of differential identities has found enormous applications in resolving a number of unresolved problems in the theory of rings. This volume summarizes the findings and approaches that have significantly advanced the field during the previous three decades. The first chapter provides a brief introduction to the topic. The following three chapters cover the various kinds of derivations in rings and algebras as well as the interactions between the structure of some classes of rings with involution and the behavior of the underlying derivations, generalized derivations, skew derivations, and β -generalized derivations, as well as their corresponding properties. Chapter 5 explores the characterization of several kinds of higher derivable mappings and the structure of Lie and Jordan-type higher derivations. Although the book contains numerous applications of the conclusions presented in these chapters, the last chapter mostly focuses on the application of derivations. This research monograph is useful for researchers working in the area of differential identities in rings and algebras. It provides a comprehensive and authoritative account of research findings.
