## **What is a Computer Algebra System?**

A computer algebra system (CAS) is software designed to perform symbolic mathematics. Unlike numerical computation tools, CAS can manipulate mathematical expressions in their symbolic form, allowing for the simplification, differentiation, integration, and solution of equations. This capability makes CAS an essential asset for mathematicians, engineers, scientists, and educators.

CAS operates on the principles of algebraic manipulation, providing users with tools to handle complex mathematical tasks. By employing algorithms for symbolic computation, these systems can provide exact solutions rather than approximate values. This is particularly useful in fields that require precise mathematical modeling.

# Key Features of CAS

The capabilities of computer algebra systems are broad and varied. Understanding these features can help users make informed decisions regarding which system to choose for their specific needs.

## Symbolic Computation

One of the primary functions of a CAS is symbolic computation. This allows users to perform operations on symbols rather than just numbers. For instance, users can differentiate or integrate functions symbolically, leading to exact expressions as results. This is crucial in theoretical mathematics and applied sciences, where exact formulations are needed.

## Equation Solving

CAS provides robust tools for solving algebraic equations, whether they are linear, polynomial, or differential equations. The ability to find exact solutions or express solutions in terms of parameters can greatly facilitate research and problem-solving in various fields.

## Matrix Operations

Matrix manipulation is another significant feature of CAS. Users can perform operations such as matrix addition, multiplication, inversion, and eigenvalue calculations with ease. This is particularly important in fields like engineering and physics, where systems of equations often manifest as matrices.

## Visualization Tools

Many CAS platforms include visualization capabilities that allow users to graph functions and data sets. This feature helps in understanding complex mathematical concepts through visual representation, making it easier for students and researchers alike to analyze and interpret results.

**cas computer algebra system:** Computer Algebra Systems Michael J. Wester, 1999-07-16 This thorough overview of the major computer algebra (symbolic mathematical) systems compares and contrasts their strengths and weaknesses, and gives tutorial information for using these systems in various ways. \* Compares different packages quantitatively using standard 'test suites' \* Ideal for assessing the most appropriate package for a particular user or application \* Examines the performance and future developments from a user's and developer's viewpoint Internationally recognized specialists overview both the general and special purpose systems and discuss issues such as denesting nested roots, complex number calculations, efficiently computing special polynomials, solving single equations and systems of polynomial equations, computing limits, multiple integration, solving ordinary differential and nonlinear evolution equations, code generation, evaluation and computer algebra in education. The historical origins, computer algebra resources and equivalents for many common operations in seven major packages are also covered. By providing such a comprehensive survey, the experienced user is able to make an informed decision on which system(s) he or she might like to use. It also allows a user new to computer algebra to form an idea of where to begin. Since each system looked at in this book uses a different language, many examples are included to aid the user in adapting to these language differences. These examples can be used as a guide to using the various systems once one understands the basic principles of one CAS. The book also includes contributions which look at the broad issues of the needs of various users and future developments, both from the user's and the developer's viewpoint. The author is a leading figure in the development and analysis of mathematical software and is well known through the 'Wester test suite' of problems which provide a bench mark for measuring the performance of mathematical software systems. The book will help develop our range of titles for applied mathematicians. The book will provide a unique, fully up-to-date and independent assessment of particular systems and will be of interest to users and purchasers of CAS's.

**cas computer algebra system:** *Computer Algebra Systems (CAS) as a Tool for Coaxing the Emergence of Reasoning about Equivalence of Algebraic Expressions* Carolyn Kieran, Luis Saldanha, 2005 Equivalence of algebraic expressions is at the heart of transformational work in algebra. However, we know very little about students' understanding of equivalence. This study is part of a larger project that explores the use of CAS as a didactical tool for promoting both technical and conceptual growth in high school algebra with tasks specially designed by the research team. We report on a class of 10th graders coming to grips with the underlying theoretical ideas related to algebraic equivalence and on the role that the CAS played in the shaping of these newly emerging notions. Two different notions of equivalence of expressions were found to emerge: one was purely numerical and entailed reasoning about expressions for which some but not necessarily all numerical substitutions would yield equal values; the other entailed both numerical and common-form reasoning. Interpretation of CAS outputs (the equality test, in particular) played a role in occasioning discussions that don't normally occur in algebra classrooms and led to clarifying distinctions about equivalence for many. Grebenikow (Computing Center of the Russian Academy of Sciences, Moscow) who drew our attention to the group of mathematicians and computer scientists at the Academy of Sciences of Moldova conducting research in the field of computer algebra. We were impressed that this group not only is concerned with applications of CA methods to problems of scientific computing but also carries out research on the fundamental principles underlying the current computer algebra systems themselves, see also their papers in the present proceedings volume. It was therefore decided to organize the 9th workshop on Computer Algebra in Scientific Computing, CASC 2006, in Chişinău, the capital of Moldova.

**cas computer algebra system: FM'99 - Formal Methods** Jeannette M. Wing, Jim Woodcock, Jim Davies, 2003-07-31 Formal methods are coming of age. Mathematical techniques and tools are now regarded as an important part of the development process in a wide range of industrial and governmental organisations. A transfer of technology into the mainstream of systems development is slowly, but surely, taking place. FM'99, the First World Congress on Formal Methods in the Development of Computing Systems, is a result, and a measure, of this new-found maturity. It brings an impressive array of industrial and applications-oriented papers that show how formal methods have been used to tackle real problems. These proceedings are a record of the technical symposium of FM'99: alongside the papers describing applications of formal methods, you will find technical reports, papers, and abstracts detailing new advances in formal techniques, from mathematical foundations to practical tools. The World Congress is the successor to the four Formal Methods Europe Symposia, which in turn succeeded the four VDM Europe Symposia. This session reflects an increasing openness within the international community of researchers and practitioners: papers were submitted covering a wide variety of formal methods and application areas. The programme committee reflects the Congress's international nature, with a membership of 84 leading researchers from 38 different countries. The committee was divided into 19 tracks, each with its own chair to oversee the reviewing process. Our collective task was a difficult one: there were 259 high-quality submissions from 35 different countries.
