Introduction to Brachial Plexus Anatomy

The brachial plexus is a network of nerves that innervates the shoulder, arm, and hand. Understanding its anatomy is crucial for diagnosing and treating various conditions affecting these areas. This section will provide a high-level overview of the brachial plexus, including its formation and the segments involved. The plexus is formed by the anterior rami of the lower four cervical nerves (C5-C8) and the first thoracic nerve (T1). These nerve roots combine to form trunks, divisions, cords, and branches that ultimately innervate the upper limb.

Detailed Anatomy of the Brachial Plexus

Formation and Structure

The brachial plexus can be divided into several components: roots, trunks, divisions, cords, and branches. Each component plays a critical role in the organization and function of the plexus.

- **Roots:** The roots are the five anterior rami of spinal nerves C5, C6, C7, C8, and T1. They emerge from the spinal cord and unite to form the trunks.
- **Trunks:** The roots combine to form three trunks: the upper trunk (C5-C6), middle trunk (C7), and lower trunk (C8-T1).
- **Divisions:** Each trunk divides into an anterior and posterior division. The anterior divisions primarily supply the flexor muscles of the arm, while the posterior divisions supply the extensor muscles.
- **Cords:** The divisions regroup to form three cords: the lateral cord, posterior cord, and medial cord, named according to their position relative to the axillary artery.
- **Branches:** The cords give rise to several important nerves, including the musculocutaneous, median, ulnar, radial, and axillary nerves.

Key Nerves and Their Functions

Each branch of the brachial plexus serves specific muscles and sensory areas of the upper limb. Understanding these branches is essential for diagnosing nerve injuries and planning treatment.

- **Musculocutaneous nerve:** Innervates the biceps brachii, brachialis, and coracobrachialis muscles.
- **Median nerve:** Supplies the majority of the flexor muscles in the forearm and thenar muscles in the hand.
- **Ulnar nerve:** Innervates the intrinsic muscles of the hand and provides sensation to the ulnar side of the hand.

- **Radial nerve:** Supplies the extensor muscles of the arm and forearm, allowing for extension at the elbow and wrist.
- **Axillary nerve:** Innervates the deltoid and teres minor muscles and provides sensation over the lateral shoulder.

Functions of the Brachial Plexus

The primary function of the brachial plexus is to facilitate movement and sensation in the upper limb. Each nerve branch has specific motor and sensory roles, which contribute to the overall functionality of the arm and hand.

Motor Functions

The brachial plexus is responsible for the motor innervation of the muscles in the shoulder, arm, forearm, and hand. This enables a wide range of movements, including:

- Flexion and extension of the elbow
- Pronation and supination of the forearm
- Wrist flexion and extension
- Finger movements, including gripping and pinching

Sensory Functions

Sensory innervation provided by the brachial plexus allows for the perception of touch, pain, temperature, and proprioception in the upper limb. Each nerve provides sensation to specific areas:

- Musculocutaneous nerve: lateral aspect of the forearm

- Median nerve: palmar surface of the thumb, index, middle finger, and part of the ring finger
- Ulnar nerve: medial aspect of the hand and little finger
- Radial nerve: posterior aspect of the arm and forearm
- Axillary nerve: skin overlying the deltoid muscle

Common Injuries and Conditions

Injuries to the brachial plexus can lead to significant impairment of motor and sensory functions in the upper limb. Understanding these injuries is vital for timely diagnosis and treatment.

Types of Injuries

Brachial plexus injuries can occur due to various causes, including trauma, stretching, or compression. The common types include:

- **Erb's Palsy:** Affects the upper trunk (C5-C6) and results from excessive pulling of the head during birth or trauma. It causes weakness in shoulder abduction and external rotation.
- **Klumpke's Palsy:** Involves injury to the lower trunk (C8-T1), often due to arm pulling. It affects the hand muscles, leading to a claw hand appearance.
- **Thoracic Outlet Syndrome:** Compression of the brachial plexus and subclavian vessels, causing pain, numbness, and weakness in the upper limb.
