business objects 3: Business Object Modeling (BOM) workbook Martine Alaerts, Patrick Derde, 2023-03-27 The Business Object Modelling (BOM) workbook treats the approach used to create and manage the BIAN Reference Data Architecture for the Financial Industry. It treats the added value this model can provide for the Financial Industry and its service providers. However, the applicability of the approach used by BIAN to create and manage its Reference Data Architecture, and the added value of such “enterprise data model”, is not limited to BIAN and the financial industry. The workbook treats the Business Object Modeling Approach and the creation, management and application of an enterprise data model in general, using BIAN as an example. After a short introduction of the general design principles and elements of BIAN’s Reference Architecture for the Financial Industry, the workbook focuses on the Business Object Modeling approach, used to create an enterprise data model, of which the BIAN Business Object Model (BIAN BOM) is one example. The Business Object Modeling approach and its Patterns is explained, illustrated by examples and exercises. This approach supports information analysis and data modeling in general, and is well suited for a step-by-step elaboration of an enterprise data model (such as the BIAN BOM). BIAN’s documentation approach, using the ArchiMate and UML languages, is explained. This approach is used to represent The BIAN BOM and manage it as an “enterprise data model” – BIAN’s Reference Data Architecture for the Financial Industry. Understanding BIAN’s documentation conventions helps the reader in exploiting BIAN’s data-related deliverables and can inspire the elaboration of a documentation approach to manage an organization’s own enterprise data model. The last part of the workbook treats the application of the Business Object Modeling approach and the BIAN BOM – or an organization’s enterprise data model, in general. They can support information analysis and data design as well as Information Governance and Enterprise Data Architecture. They can facilitate the cooperation with partners and service providers. The Business Object Modelling (BOM) workbook accompanies the BIAN Data Architecture & Design Specialist training.

business objects 3: *Life and Motion of Socio-Economic Units* Andrew Frank, Jonathan Raper, J. P. Cheylan, 2003-09-02 One of the ongoing problems researchers in geography and GIS have is studying data that is inherently spatial over a long period of time. One of the main hurdles they have to overcome is the study of groups of people classified by their socio-economic status (one of the main means for governments, companies and research organisations to group together segments of the population). The amount of data collected by governments, business and research organisations has increased markedly in recent years. Geographic Information Systems have been more widely used than ever before for the storage and analysis of this information. Most GIS can handle this information spatially rather than temporally, and have difficulty with the management of socio-economic time series, which relate to spatial units. Accordingly, this book covers the issues ranging from the formal model to differentiate aspects of spatio-temporal data, through philosophical and fundamental reconsideration of time and space to the development of practical solutions to the problem. This book draws together an interdisciplinary group of scientists in the field of geography, computing, surveying and philosophy. It presents the definitive sourcebook on temporal GIS as applied to socio-economic units.
