license office 365 business: Introduction to Client access license Gilad James, PhD, An Introduction to Client Access License (CAL) is a license system widely used in the IT industry to regulate access to server software. CAL is a type of license that gives a user access permission to connect to a server and thus avail its various services. It is a type of license that comes with every Windows Server purchased. A CAL has to be purchased for every user or every device that requires access to the server. CALs come in various forms such as user CALs, device CALs. These licenses are essential in regulating access to server software such that organizations only use the software to an extent allowed by the license. CALs are usually purchased to enable end-users to be able to connect to a server and avail of its services. They are commonly used in organizations where employees use more than one device to access the server. The CAL system ensures that devices or users access the software according to the allowed limit, ensuring compliance with the license. CALs are especially useful in enterprises that find themselves in need of expanding their current infrastructure. When a company installs a new server or upgrades their current one, it has to purchase additional CALs to accommodate the new needs. The system is especially important in organizations seeking to stay compliant with licensing regulations, which if violated, can result in substantial penalties.

With Windows 10, organizations can create a consistent set of configurations across the modern enterprise desktop—for PCs, tablets, and phones—through the common Mobile Device Management (MDM) layer. MDM gives organizations a way to configure settings that achieve their administrative intent without exposing every possible setting. One benefit of MDM is that it enables organizations to apply broader privacy, security, and application management settings through lighter and more efficient tools. MDM also allows organizations to target Internet-connected devices to manage policies without using Group Policy (GP) that requires on-premises domain-joined devices. This makes MDM the best choice for devices that are constantly on the go. With Microsoft making this shift to using Mobile Device Management (MDM), a cloud-based policy-management system, IT professionals need to know how to do similar tasks they do with Group Policy, but now using MDM, with its differences and pitfalls. What is MDM
