Introduction to Calculus 3

Calculus 3, often referred to as multivariable calculus, expands the concepts learned in earlier calculus courses to functions of several variables. This course introduces students to new dimensions of mathematical analysis, focusing on functions that depend on two or more variables. Understanding these functions is crucial for fields such as physics, engineering, and economics, where multiple factors can influence outcomes.

In this section, we will explore the foundational concepts that will be built upon in subsequent sections, including the notation and basic principles of multivariable functions. Students must familiarize themselves with the graphical representation of these functions, which often involve surfaces in

three-dimensional space.

Finding Limits in Multivariable Functions

Understanding Limits

Finding limits in multivariable functions is a critical skill in Calculus 3. The limit of a function as it approaches a point can often be different than its value at that point, particularly in three-dimensional space. To find limits, students should consider approaching the point along different paths.

Example Problem

Consider the function $f(x, y) = (x^2 + y^2) / (x^2 + y^2 - 1)$.

Calculate the limit as (x, y) approaches $(1, 0)$.

To solve this, we analyze the function as we approach $(1, 0)$ from various paths.

1. Approach along the line $y = 0$:

$$- f(1, 0) = (1^2 + 0^2) / (1^2 + 0^2 - 1) = 1 / 0 \text{ (undefined).}$$

2. Approach along the line $x = 1$:

$$- f(1, y) = (1^2 + y^2) / (1^2 + y^2 - 1) = (1 + y^2) / (y^2) = 1/y^2$$

(approaches infinity as y approaches 0).

Since the limit is undefined in this case, the limit does not exist.

Partial Derivatives and Their Applications

Defining Partial Derivatives

Partial derivatives represent the rate of change of a multivariable function with respect to one variable while holding the others constant. This concept is fundamental in exploring how changes in one variable affect the overall function.

Example Problem

Given the function $f(x, y) = x^2y + \sin(y)$, calculate the partial derivatives $\partial f/\partial x$ and $\partial f/\partial y$.

1. To find $\partial f/\partial x$:

- Differentiate f with respect to x , treating y as a constant:
- $\partial f/\partial x = 2xy$.

2. To find $\partial f/\partial y$:

- Differentiate f with respect to y , treating x as a constant:
- $\partial f/\partial y = x^2 + \cos(y)$.

These partial derivatives provide insight into how the function behaves in relation to each variable.

Multiple Integrals: Double and Triple Integrals

Double Integrals

Double integrals are used to calculate the volume under a surface defined by a function of two variables.

Example Problem

Evaluate the double integral of $f(x, y) = x + y$ over the rectangle $R = [0, 1] \times [0, 1]$.

The double integral is set up as follows:

$$\iint_R (x + y) \, dA = \int_{\text{from } 0 \text{ to } 1} \left(\int_{\text{from } 0 \text{ to } 1} (x + y) \, dy \right) dx.$$

Calculating the inner integral first:

$$\int_{\text{from } 0 \text{ to } 1} (x + y) \, dy = [xy + (y^2)/2]_{\text{from } 0 \text{ to } 1} = x + 1/2.$$

Now, calculate the outer integral:

$$\int_{\text{from } 0 \text{ to } 1} (x + 1/2) \, dx = [x^2/2 + (x/2)]_{\text{from } 0 \text{ to } 1} = 1/2 + 1/4 = 3/4.$$

Thus, the value of the double integral is $3/4$.

Triple Integrals

Triple integrals extend the concept of double integrals into three dimensions, allowing for the calculation of volume in three-dimensional space.

Example Problem

Evaluate the triple integral of $f(x, y, z) = xyz$ over the cube defined by $[0, 1] \times [0, 1] \times [0, 1]$.

Set up the integral:

$$\iiint_C (xyz) \, dV = \int_{\text{from } 0 \text{ to } 1} \left(\int_{\text{from } 0 \text{ to } 1} \left(\int_{\text{from } 0 \text{ to } 1} (xyz) \, dz \right) dy \right) dx.$$

Calculating sequentially:

1. Inner integral with respect to z :

$$\int_{\text{from } 0 \text{ to } 1} (xyz) \, dz = xy \left[\frac{z^2}{2} \right]_{\text{from } 0 \text{ to } 1} = xy \left(\frac{1}{2} \right).$$

2. Middle integral with respect to y :

$$\int_{\text{from } 0 \text{ to } 1} (xy/2) \, dy = \left[\frac{xy^2}{4} \right]_{\text{from } 0 \text{ to } 1} = x/4.$$

3. Outer integral with respect to x :

$$\int_{\text{from } 0 \text{ to } 1} (x/4) \, dx = \left[\frac{x^2}{8} \right]_{\text{from } 0 \text{ to } 1} = 1/8.$$

The value of the triple integral is $1/8$.

Vector Calculus: Gradient, Divergence, and Curl

Understanding Vector Fields

Vector calculus is essential in understanding fields and flows in physical contexts. The gradient, divergence, and curl are vital operators in this field.

Example Problem: Gradient

Given the scalar field $f(x, y, z) = x^2 + y^2 + z^2$, compute the gradient ∇f .

The gradient is computed as follows:

$$\nabla f = (\partial f / \partial x, \partial f / \partial y, \partial f / \partial z) = (2x, 2y, 2z).$$

This vector field points in the direction of the greatest rate of increase of the function f .

Example Problem: Divergence

For the vector field $F(x, y, z) = (xy, x^2z, yz)$, compute the divergence.

The divergence is calculated by:

$$\nabla \cdot F = \partial(xy) / \partial x + \partial(x^2z) / \partial y + \partial(yz) / \partial z = y + 0 + y = 2y.$$

This indicates how much the vector field is expanding at a given point.

Example Problem: Curl

Compute the curl of the vector field $F(x, y, z) = (y, z, x)$.

Using the curl formula:

$$\nabla \times F = (\partial / \partial y - \partial / \partial z)(F_3) - (\partial / \partial z - \partial / \partial x)(F_2) + (\partial / \partial x - \partial / \partial y)(F_1).$$

Calculating gives us:

$$\nabla \times F = (1 - 0, 0 - 1, 0 - 0) = (1, -1, 0).$$

This result provides insight into the rotation of the vector field in three-dimensional space.

The problems are in the first part of the book and the solutions are in the second, so that readers may challenge themselves to solve the questions on their own before looking at the explanations. The problems show how mathematics—including algebra, trigonometry, geometry, and calculus—can be united with physical laws to solve both real and theoretical problems. Historical anecdotes woven throughout the book bring alive the circumstances and people involved in some amazing discoveries and achievements. More than a puzzle book, this work will immerse you in the delights of scientific history while honing your math skills.
