julius ai for calculus: Artificial Intelligence and Tortious Liability Nasir Muftić, 2025-03-14 This book examines whether current liability systems can handle cases involving artificial intelligence (AI). It questions whether general liability rules, designed to be technology-agnostic, are adequate for AI-related accidents. While focusing on Bosnia and Herzegovina, it addresses issues relevant across Europe, offering answers based on common principles and tort law rules. The book begins with an introduction to AI technology and associated civil law challenges regarding e.g. autonomy, data importance, and non-transparency. It then discusses the broader context of civil law issues, the role of liability systems, rule-making levels and timing, and ancillary mechanisms like insurance and safety standards. The bases of liability in Bosnia and Herzegovina are examined, including objective and subjective liability, product liability, and vicarious liability. The allocation of liability is also addressed, focusing on AI's autonomy and loss of user control, and evaluating traditional liability allocation principles. Finally, the book analyzes why those harmed by AI might be worse off than those affected by conventional adverse events.

julius ai for calculus: *Structure and Interpretation of Classical Mechanics*, second edition Gerald Jay Sussman, Jack Wisdom, 2015-02-13 The new edition of a classic text that concentrates on developing general methods for studying the behavior of classical systems, with extensive use of computation. We now know that there is much more to classical mechanics than previously suspected. Derivations of the equations of motion, the focus of traditional presentations of mechanics, are just the beginning. This innovative textbook, now in its second edition, concentrates on developing general methods for studying the behavior of classical systems, whether or not they have a symbolic solution. It focuses on the phenomenon of motion and makes extensive use of computer simulation in its explorations of the topic. It weaves recent discoveries in nonlinear dynamics throughout the text, rather than presenting them as an afterthought. Explorations of

phenomena such as the transition to chaos, nonlinear resonances, and resonance overlap to help the student develop appropriate analytic tools for understanding. The book uses computation to constrain notation, to capture and formalize methods, and for simulation and symbolic analysis. The requirement that the computer be able to interpret any expression provides the student with strict and immediate feedback about whether an expression is correctly formulated. This second edition has been updated throughout, with revisions that reflect insights gained by the authors from using the text every year at MIT. In addition, because of substantial software improvements, this edition provides algebraic proofs of more generality than those in the previous edition; this improvement permeates the new edition.

julius ai for calculus: **Geometric Control Theory** Velimir Jurdjevic, 1997 Geometric control theory is concerned with the evolution of systems subject to physical laws but having some degree of freedom through which motion is to be controlled. This book describes the mathematical theory inspired by the irreversible nature of time evolving events. The first part of the book deals with the issue of being able to steer the system from any point of departure to any desired destination. The second part deals with optimal control, the question of finding the best possible course. An overlap with mathematical physics is demonstrated by the Maximum principle, a fundamental principle of optimality arising from geometric control, which is applied to time-evolving systems governed by physics as well as to man-made systems governed by controls. Applications are drawn from geometry, mechanics, and control of dynamical systems. The geometric language in which the results are expressed allows clear visual interpretations and makes the book accessible to physicists and engineers as well as to mathematicians.
