**purdue calculus 1: Research in Collegiate Mathematics Education IV** Ed Dubinsky, 2000 This fourth volume of Research in Collegiate Mathematics Education (RCME IV) reflects the themes of student learning and calculus. Included are overviews of calculus reform in France and in the U.S. and large-scale and small-scale longitudinal comparisons of students enrolled in first-year reform courses and in traditional courses. The work continues with detailed studies relating students' understanding of calculus and associated topics. Direct focus is then placed on instruction and student comprehension of courses other than calculus, namely abstract algebra and number theory.

The volume concludes with a study of a concept that overlaps the areas of focus, quantifiers. The book clearly reflects the trend towards a growing community of researchers who systematically gather and distill data regarding collegiate mathematics' teaching and learning. This series is published in cooperation with the Mathematical Association of America.

**purdue calculus 1: Optimization—Theory and Applications** L. Cesari, 2012-12-06 This book has grown out of lectures and courses in calculus of variations and optimization taught for many years at the University of Michigan to graduate students at various stages of their careers, and always to a mixed audience of students in mathematics and engineering. It attempts to present a balanced view of the subject, giving some emphasis to its connections with the classical theory and to a number of those problems of economics and engineering which have motivated so many of the present developments, as well as presenting aspects of the current theory, particularly value theory and existence theorems. However, the presentation of the theory is connected to and accompanied by many concrete problems of optimization, classical and modern, some more technical and some less so, some discussed in detail and some only sketched or proposed as exercises. No single part of the subject (such as the existence theorems, or the more traditional approach based on necessary conditions and on sufficient conditions, or the more recent one based on value function theory) can give a sufficient representation of the whole subject. This holds particularly for the existence theorems, some of which have been conceived to apply to certain large classes of problems of optimization. For all these reasons it is essential to present many examples (Chapters 3 and 6) before the existence theorems (Chapters 9 and 11-16), and to investigate these examples by means of the usual necessary conditions, sufficient conditions, and value function theory.

He was also--as NASA historian Hansen reveals in this authorized biography--misunderstood. Armstrong's accomplishments as an engineer, a test pilot, and an astronaut have long been a matter of record, but Hansen's access to private documents and unpublished sources and his interviews with more than 125 subjects (including more than fifty hours with Armstrong himself) yield the first in-depth analysis of this elusive, reluctant hero.

However, unlike the much better-known field of engineering, engineering technology (ET) is unfamiliar to most Americans and goes unmentioned in most policy discussions about the US technical workforce. Engineering Technology Education in the United States seeks to shed light on the status, role, and needs of ET education in the United States.

**purdue calculus 1: Flaming Floorboards** Steve Tom, 2012-03-12 Are you tired of cleaning spiders out of your gas gauge? Have you driven for miles wondering what that funny smell was, only to discover your seat was on fire? Did your tender first kiss leave your date needing medical attention? If you can answer yes to all three questions, you're probably the author of this book. Flaming Floorboards is a true account of these and many similar adventures which befell the author, a man who ambled through life adopting stray cars the way other people adopt stray cats. He came of automotive age during the 1960's, the golden age of muscle cars. Surrounded by Camaros, Mustangs, Super Birds, and their ilk, his dream car was a Stanley Steamer. (Looking back, the author admits it may not have been a coincidence that he didn't get many dates.) He never did get a Stanley, but over the years he drove thousands of miles in cars such as a Model A Ford, a Jaguar E-Type, a pair of mid-60's Chevy Impalas, a handful of MG's, and other memorable automobiles. These were not shiny classics when he drove them. They were rusted hulks that he rescued from the salvage yard. In his struggles to keep these rolling wrecks on the road he encountered people like Fr. Dupree, a reporter/pool shark turned Episcopal priest; Luis Riccotto, the proprietor of Riccotto and Sons Imported motors; and Otis Swineheart, a man of few words and fewer teeth. Flaming Floorboards is a warm and funny story about an extraordinary cast of cars and characters.
