Understanding Particle Motion

When studying particles in motion, it is essential to grasp the basic concepts of kinematics. Kinematics is the branch of physics that describes the motion of objects without considering the forces that cause the motion. The primary quantities involved in kinematics are position, velocity, and acceleration.

Defining Position, Velocity, and Acceleration

Position refers to the location of a particle in space at any given time. It can be represented mathematically as a function of time, typically denoted as (s(t)). Velocity is defined as the rate of change of position with respect to time, which can be expressed as the derivative of the position function:

```
[v(t) = s'(t)]
```

Acceleration is the rate of change of velocity with respect to time, defined as the derivative of the velocity function:

```
[ a(t) = v'(t) = s''(t) ]
```

Types of Motion

Particles can exhibit various types of motion, including:

- **Uniform Motion:** The particle moves at a constant speed in a straight line.
- Accelerated Motion: The particle's velocity changes over time, either increasing or decreasing.
- **Decelerated Motion:** The particle experiences a decrease in speed, which is also a form of acceleration in the opposite direction.

Understanding these types of motion is crucial for analyzing when a particle is at rest.

Mathematical Concepts of Motion

In calculus, the relationships between position, velocity, and acceleration are fundamental to understanding motion. The concept of derivatives plays a central role in this analysis.

Derivatives and Their Importance

The derivative of a function provides important information about the behavior of that function. In the context of motion:

- The first derivative of the position function, \(s'(t) \), gives the velocity.
- The second derivative, (s''(t)), provides the acceleration.

These derivatives are vital for determining when a particle is at rest, as they help identify critical points in motion.

Critical Points and Their Significance

A critical point occurs when the first derivative of a function equals zero or is undefined. In the context of particle motion, this means that the velocity is zero, indicating that the particle may be at rest. To analyze critical points, one often uses:

- Finding $\ (s'(t) = 0 \)$ to locate potential points where the particle is at rest.
- Examining the behavior of the derivative before and after these points to confirm whether the particle is indeed at rest.

Mathematical analysis of these critical points leads to a clearer understanding of the motion of the particle.

Finding When a Particle is at Rest

To determine when a particle is at rest, follow a systematic approach using the position function.

Step-by-Step Method

- 1. Identify the Position Function: Obtain the function \setminus (s(t) \setminus) that describes the particle's position over time.
- 2. Differentiate the Position Function: Compute the first derivative, (v(t) = s'(t)), to find the velocity function.
- 3. Set the Velocity Equal to Zero: Solve the equation (v(t) = 0) to find the times (t) when the particle is at rest.
- 4. Verify Critical Points: Analyze the behavior of the velocity function around the critical points to confirm that the particle is indeed at rest.

Example Problem

```
Consider a particle whose position is given by the function:  \begin{tabular}{l} & (s(t) = t^3 - 6t^2 + 9t \\ & (s(t) = t^3 - 6t^2 + 9t \\ & (s(t) = t^3 - 6t^2 + 9t \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (s(t) = t^3 - 12t + 9t) \\ & (
