delta math com: Surveillance Education Nolan Higdon, Allison Butler, 2024-08-02

Surveillance Education explores the pervasive use of digital surveillance technologies in schools and assesses its pernicious effects on students. Recognizing that the use of digital technologies will persist, the authors instead offer practical ways to ameliorate their impact. In our era of surveillance capitalism, digital media technologies are ever more intertwined into the educational process. Schools are presented with digital technologies as tools of convenience for gathering and grading student work, as tools of support to foster a more equitable learning environment, and as tools of safety for predicting or preventing violence or monitoring mental, emotional, and physical health. Despite a dearth of evidence to confirm their effectiveness, digital data collection and tracking is often presented as a way to improve educational outcomes and safety. This book challenges these fallacious assumptions and argues that the use of digital media technologies has caused great harm to students by subjecting them to oppressive levels of surveillance, impinging upon their right to privacy, and harvesting their personal data on behalf of Big-Tech. In doing so, the authors draw upon interviews from K-12 and higher education students, teachers, and staff, civil rights and technology lawyers, and educational technological programmers. The authors also provide practical guidance for teachers, administrators, students, and their families seeking to identify and combat surveillance in education. This urgent, eye-opening book will be of interest to students and educators with interests in critical media literacy and pedagogy and the sociology of technology and education.

delta math com: Teaching Math With Examples Michael Pershan, 2021-02-23 Some teachers think that there’s little to say about teaching with examples – after all, everyone uses them. But here are just some of the questions you might have about teaching with worked examples: How do we introduce an example? What do we ask students to do when studying a solution? Should a solution be presented all at once or revealed step-by-step? After we study an example, what comes next? Does it matter if the solution is presented as if from a fictional student, a real student in class, or from the teacher? How do we help students move from understanding someone else’s ideas towards using it on their own to solve problems? How do we write a solution in a clear way, that students can learn from? When is a good time to offer a worked example? When is it better to let students try a problem? Are worked examples more useful for some mathematical content than others? This book will answer all of these questions. In some cases, research offers answers. Other questions represent gaps in the research literature and the book offers solutions arrived at through experience and trial-and-error and the author’s own process of classroom problem solving. Welcome to the world of teaching with examples!

delta math com: New Vision Of An Old Cluster, A - Untangling Coma Berenices Alain Mazure, Fabienne Casoli, Florence Durret, Daniel Gerbal, 1998-08-15 Together with Virgo, the Coma Berenices cluster is one of the most well-studied clusters at all wavelengths and in all aspects, from the Sunyaev-Zeldovich effect to star formation in galaxies. In a way, it is the prototype of rich clusters. Recent observational results, linked to the improvement of techniques such as X-ray and UV observations, along with multi-object spectroscopy, have shown that they could change our vision of this cluster. It is thus time for observers and theoreticians to confront all these new ideas and observations on the Coma cluster. The topics in this volume include: cosmological aspects of the Coma cluster, comparison with distant clusters; substructures; matter content and distribution; Sunyaev-Zeldovich effect; dynamical modelling, cluster dynamics; environmental effects on galaxies, star formation.
