Whether you're preparing for board exams or sharpening your clinical decision-making skills, this built-in review section offers an excellent tool for self-assessment. SAMPLE of multiple choice questions: A 33-year-old woman presents with depressed mood and fatigue for over 2 years. She denies suicidal ideation or anhedonia. Symptoms do not meet criteria for a major depressive episode, but they are persistent and impairing. What is the most likely diagnosis? A. Dysthymia (persistent depressive disorder) B. Cyclothymia C. Adjustment disorder with depressed mood D. Major depressive disorder Answer: A Explanation: Persistent depressive disorder (dysthymia) is defined by depressed mood for at least 2 years, with no symptom-free period greater than 2 months. It is often less severe but more chronic than MDD. A 65-year-old woman with Alzheimer disease is brought to clinic by her daughter due to increasing aggression, yelling, and wandering. She has started striking her caregivers when they redirect her. She is already on donepezil. What is the most appropriate next pharmacologic step? A. Add risperidone B. Increase donepezil dose C. Add lorazepam D. Add memantine Answer: A Explanation: In severe behavioral disturbances in dementia, low-dose atypical antipsychotics (e.g., risperidone) are used cautiously and short-term. Benzodiazepines worsen confusion and falls. Memantine helps cognition but not aggression. A 35-year-old woman reports feelings of emptiness, unstable relationships, and impulsive behaviors including binge eating and substance use. She

frequently engages in self-harm. What is the best treatment approach? A. Dialectical behavior therapy B. Cognitive-behavioral therapy only C. Antipsychotic medication D. Electroconvulsive therapy Answer: A Explanation: Dialectical behavior therapy is the evidence-based psychotherapy for borderline personality disorder and self-harming behaviors.
