envision math geometry teacher edition: Cosmology, Quantum Vacuum and Zeta Functions Sergey D. Odintsov, Diego Sáez-Gómez, Prof. Dr. S. Xambó-Descamps Universitat Politècnica de Catalunya, 2011-06-10 Some major developments of physics in the last three decades are addressed

by highly qualified specialists in different specific fields. They include renormalization problems in QFT, vacuum energy fluctuations and the Casimir effect in different configurations, and a wealth of applications. A number of closely related issues are also considered. The cosmological applications of these theories play a crucial role and are at the very heart of the book; in particular, the possibility to explain in a unified way the whole history of the evolution of the Universe: from primordial inflation to the present day accelerated expansion. Further, a description of the mathematical background underlying many of the physical theories considered above is provided. This includes the uses of zeta functions in physics, as in the regularization problems in QFT already mentioned, specifically in curved space-time, and in Casimir problems as.

envision math geometry teacher edition: Getting to Know Ourselves and Others

Through the ABCs Claudia Finkbeiner, Althier Lazar, 2015-01-01 This book is a valuable resource for teachers and other professionals who are looking for a proven way to increase cultural appreciation and awareness. New applications of the ABCs model of Cultural Understanding and Communication are presented and discussed in this new volume, based on studies done in the United States, and Canada and Europe. In this ground-breaking project, the authors describe how the ABCs model complicated and challenged and changed the cultural perceptions of those who participated in it, even those who were initially highly resistant to such possibilities. At the heart of the project is the exchange of narratives – life stories that give insight into the cultural worlds of selves and others. In addition to the narratives, other instruments including the Transcultural Competence Scale (TCC), provide further evidence of the positive impact of the ABCs on participants' receptivity toward cultural differences. In the TRANSABCs project, researchers from both sides of the Atlantic invited teacher candidates, students who will become workplace and other professionals to write an autobiography (A) of themselves from various cultural perspectives, a biography (B) of an individual who is culturally different from themselves along particular dimensions, and to use these documents to conduct cross-cultural comparisons (C) between themselves and the person they interviewed. Furthermore, candidates developed culturally responsive ideas for the school or the workplace (C). These exchanges and analyses produced epiphanies and insights that translated into specific actions to improve cultural understanding and communication in classrooms and workplaces. Educators and professionals can take from these examples to inspire their own personal journey toward greater cultural understanding and sensitivity.

envision math geometry teacher edition: Eastern European Mathematics Education in the Decades of Change Alexander Karp, 2020-05-04 This contributed volume is devoted to the recent history and evolution of mathematics education in Eastern Europe, exploring how it was influenced by social and political changes in this part of the world. Despite the broad recognition of the importance of these changes, little scholarship exists that examines the ways in which they were followed by changes in the teaching of mathematics in the post-socialist countries. Indeed, the analyzed processes are complex and vary across the states. Accordingly, this book touches on many factors--including differences in cultures and traditions -- that find expression in the teaching of mathematics. Specifically, this volume seeks to explore what changes there were in education in general and in the position of mathematics in school education in these years, and how these changes may be explained and documented; what changes there were in the content of mathematics education and its assessment, and how were they motivated and adopted; what new textbooks appeared and what new methodological ideas were offered in them; how and why mathematics teacher education and/or professional development changed; what was the role (if any) of foreign influences on mathematics education, etc. The book will be of interest to both researchers in mathematics education and practitioners-teachers, as well as a broader audience of historians and educators exploring the political aspects of education.
