

gcn training parameters

gcn training parameters are critical factors influencing the performance and effectiveness of Graph Convolutional Networks (GCNs) in various machine learning tasks. Proper tuning and selection of these parameters can significantly impact the accuracy, convergence speed, and generalization ability of GCN models. This article delves into the essential gcn training parameters, exploring their roles and best practices for optimization. Understanding these parameters is crucial for practitioners aiming to leverage GCNs for applications such as node classification, link prediction, and graph embedding. The discussion will cover common parameters like learning rate, number of layers, hidden units, dropout rate, and regularization techniques. Additionally, it will address practical considerations in training GCNs, including batch size and optimization algorithms. The following table of contents outlines the key aspects of gcn training parameters examined in this article.

- Key gcn Training Parameters
- Optimization and Learning Rate
- Network Architecture Parameters
- Regularization Techniques in GCN Training
- Training Strategies and Practical Considerations

Key gcn Training Parameters

Graph Convolutional Networks rely on a set of core training parameters that define the model's structure and learning process. These parameters influence how the model processes graph data and adapts during training. Understanding the function and impact of each parameter is essential for effective model design and tuning. The primary gcn training parameters include the learning rate, number of layers, hidden units per layer, dropout rate, weight decay, and batch size. Each of these plays a distinct role in shaping the network's capacity, stability, and performance.

Learning Rate

The learning rate controls the step size at which the model updates its weights during optimization. It is one of the most sensitive and important gcn training parameters. A learning rate that is too high can cause the training to diverge, while a rate that is too low may result in slow convergence or getting stuck in

local minima. Typically, a range from 0.001 to 0.01 is used, but this depends on the dataset and optimizer choice.

Number of Layers

The number of layers in a GCN defines how many times information is aggregated from neighboring nodes. Increasing layers allows the model to capture higher-order graph structures but can also lead to over-smoothing, where node representations become indistinguishable. Common practices involve using 2 to 4 layers, balancing depth and performance.

Hidden Units

The hidden units parameter specifies the dimensionality of the feature vectors in each layer. This determines the model's capacity to learn complex representations. More hidden units can capture richer features but increase computational cost and risk of overfitting. Typical values range from 16 to 128 units per layer depending on the task complexity.

Optimization and Learning Rate

Optimization strategies and learning rate schedules are pivotal in the training of GCNs. Selecting appropriate optimizers and adjusting the learning rate during training can enhance convergence speed and model accuracy. These components are tightly connected with the choice of gcnn training parameters.

Optimizers Used in GCN Training

Popular optimizers for GCN training include Stochastic Gradient Descent (SGD), Adam, and RMSprop. Among these, Adam is widely favored due to its adaptive learning rate capabilities, which often lead to faster and more stable convergence. The choice of optimizer affects how the learning rate behaves and interacts with other parameters.

Learning Rate Scheduling

Implementing learning rate schedules can improve training outcomes by reducing the learning rate as training progresses. Common approaches include step decay, exponential decay, and cosine annealing. These schedules help prevent overshooting minima and encourage fine-tuning towards convergence. Adjusting the learning rate dynamically is a recommended practice when dealing with complex graph datasets.

Network Architecture Parameters

The architecture of a GCN is defined by parameters that control the structure and size of the network layers. These parameters influence the model's ability to extract meaningful features from graph data and generalize well to unseen samples.

Number of Layers and Their Impact

Increasing the number of layers allows the GCN to incorporate information from nodes further away in the graph. However, too many layers may cause problems such as vanishing gradients and over-smoothing, which degrade model performance. Careful tuning of the depth is necessary to maintain balance between expressiveness and stability.

Hidden Layer Size

The size of each hidden layer determines the feature representation capacity of the network. Larger hidden layers can learn more complex patterns but require more data and computational resources to avoid overfitting. Selecting an appropriate hidden size depends on the complexity of the graph data and the availability of training samples.

Activation Functions

Activation functions introduce non-linearity into the GCN, enabling it to model complex relationships. The Rectified Linear Unit (ReLU) is the most commonly used activation function in GCN architectures due to its simplicity and effectiveness. Other functions, such as Leaky ReLU or ELU, may be employed to address specific issues like dying neurons or negative activations.

Regularization Techniques in GCN Training

Regularization is essential in GCN training parameters to prevent overfitting and improve the model's generalization to unseen data. Various regularization methods can be applied, each contributing differently to model robustness.

Dropout

Dropout randomly deactivates a fraction of neurons during training, forcing the network to learn redundant representations and reducing reliance on specific nodes. Typical dropout rates for GCNs range from 0.3 to 0.6. Applying dropout to both the input features and intermediate layers is a common practice to

enhance regularization.

Weight Decay (L2 Regularization)

Weight decay adds a penalty proportional to the squared magnitude of the network parameters to the loss function. This discourages large weights and encourages simpler models. Weight decay coefficients usually range between 0.0001 and 0.01, depending on the dataset and model complexity.

Early Stopping

Early stopping halts training when the validation loss stops improving, preventing overfitting by avoiding unnecessary epochs. This technique is particularly useful when training GCNs on limited data, where prolonged training can lead to memorization rather than generalization.

Training Strategies and Practical Considerations

Effective training of GCNs involves not only selecting optimal gcnn training parameters but also considering practical strategies related to data handling, batch processing, and computational resources.

Batch Size and Graph Sampling

Due to the interconnected nature of graph data, training GCNs often requires specialized batching or sampling techniques. Full-batch training uses the entire graph but can be memory-intensive for large datasets. Mini-batch training with neighborhood sampling or subgraph extraction reduces memory requirements and speeds up training.

Epochs and Convergence

The number of training epochs should be sufficient to allow the model to converge without overfitting. Typical training involves tens to hundreds of epochs, monitored via validation metrics. Adjusting epochs in conjunction with early stopping enhances training efficiency.

Data Preprocessing

Preprocessing steps such as feature normalization, graph normalization (e.g., symmetric normalization of adjacency matrices), and handling missing data impact training stability. Proper preprocessing complements gcnn training parameters to achieve optimal model performance.

Hardware and Computational Resources

Training GCNs can be computationally demanding, especially with large graphs or deep architectures. Utilizing GPUs and efficient graph processing libraries can accelerate training. Resource constraints may influence the choice of gcnn training parameters, especially layer size and batch strategy.

- Learning rate and optimizer selection
- Number of layers and hidden units
- Regularization methods like dropout and weight decay
- Batch size and graph sampling techniques
- Early stopping and training epochs
- Data preprocessing and normalization
- Hardware considerations

Frequently Asked Questions

What are the key training parameters for a Graph Convolutional Network (GCN)?

Key training parameters for a GCN typically include the learning rate, number of epochs, batch size, number of layers, hidden units per layer, dropout rate, and weight decay (L2 regularization). These parameters influence the model's ability to learn and generalize from graph-structured data.

How does the learning rate affect GCN training?

The learning rate controls the step size during gradient descent updates. A learning rate that is too high can cause the training to diverge, while a learning rate that is too low can result in slow convergence. Proper tuning is essential for stable and efficient GCN training.

Why is the number of layers important in a GCN?

The number of layers in a GCN determines how many times the node features are aggregated from

neighboring nodes. Too few layers may lead to underfitting as the model captures limited neighborhood information, while too many layers can cause over-smoothing, where node representations become indistinguishable.

What role does dropout play in GCN training?

Dropout is used as a regularization technique to prevent overfitting by randomly dropping a fraction of nodes or features during training. In GCNs, applying dropout to the node features or the graph convolution layers helps improve generalization.

How is batch size managed in GCN training given graph data is interconnected?

Batch size in GCN training can be challenging due to dependencies across nodes. Techniques like mini-batch training with neighborhood sampling (e.g., GraphSAGE) are used to create manageable batches by sampling local subgraphs, allowing efficient training on large graphs.

What is weight decay and how does it benefit GCN training?

Weight decay, or L2 regularization, adds a penalty to the loss function proportional to the squared magnitude of the weights. This discourages complex models that overfit the training data, promoting simpler models and improving generalization in GCN training.

How can early stopping be used when training GCNs?

Early stopping monitors the model's performance on a validation set during training and halts training when the performance stops improving for a set number of epochs. This prevents overfitting and can save computational resources during GCN training.

Additional Resources

1. Graph Convolutional Networks: Fundamentals and Parameter Optimization

This book provides a comprehensive introduction to graph convolutional networks (GCNs), focusing on the key training parameters that influence model performance. It covers topics such as learning rates, weight initialization, and regularization techniques specifically tailored for GCN architectures. Readers will gain practical insights into tuning hyperparameters to improve accuracy and generalization on graph-based tasks.

2. Deep Learning on Graphs: Tuning GCNs for Real-World Applications

Focusing on real-world applications, this book explores how to effectively train GCNs by adjusting parameters like batch size, dropout rates, and layer depth. It includes case studies in social networks, recommendation systems, and molecular graph analysis. The text balances theoretical background with hands-on advice for practitioners aiming to optimize GCN models.

3. Hyperparameter Strategies for Graph Neural Networks

This volume delves into advanced hyperparameter tuning strategies specific to graph neural networks, including GCNs. It discusses automated tuning methods such as grid search, random search, and Bayesian optimization. The book also highlights the impact of parameters like propagation steps and aggregation functions on model outcomes.

4. Training Techniques for Graph Convolutional Networks

Designed for both beginners and experienced researchers, this book covers a variety of training techniques that influence GCN performance. Topics include gradient clipping, learning rate schedules, and early stopping criteria. Detailed experiments illustrate how these parameters affect convergence speed and model robustness.

5. Graph Neural Networks: Parameter Sensitivity and Performance Analysis

This book investigates the sensitivity of GCN models to different training parameters through extensive empirical studies. It provides readers with frameworks to analyze and interpret parameter impacts on model metrics such as accuracy, recall, and F1 score. Practical guidelines help optimize training setups for diverse graph datasets.

6. Optimizing Graph Convolutional Networks for Large-Scale Graphs

Addressing the challenges of scaling GCNs, this text focuses on parameter choices that enable efficient training on massive graphs. It discusses mini-batch sampling strategies, memory-efficient architectures, and tuning parameters to balance speed and accuracy. The book is ideal for researchers working with big data in graph domains.

7. Regularization and Dropout Techniques in GCN Training

This specialized book examines regularization methods and dropout techniques to prevent overfitting in GCNs. It explains how parameters controlling these techniques can be fine-tuned for different graph structures and tasks. Experimental results demonstrate improvements in model generalization and stability.

8. Learning Rate Schedules and Adaptive Optimization for GCNs

Focusing on optimization algorithms, this book explores various learning rate schedules and adaptive optimizers like Adam and RMSProp in the context of GCN training. It guides readers through selecting and tuning these parameters to achieve faster convergence and better performance. Practical examples highlight the interplay between optimizers and GCN architectures.

9. Layer Design and Parameter Tuning in Graph Convolutional Networks

This book provides an in-depth look at the architectural parameters of GCN layers, including the number of layers, hidden units, and activation functions. It discusses how these parameters interact with training settings to influence final model results. Readers will learn techniques for designing and tuning GCN layers to suit specific applications and datasets.

gcn training parameters: *Scaling Graph Learning for the Enterprise* Ahmed Menshawy, Sameh Mohamed, Maraim Rizk Masoud, 2025-08-06 Tackle the core challenges related to enterprise-ready graph representation and learning. With this hands-on guide, applied data scientists, machine learning engineers, and practitioners will learn how to build an E2E graph learning pipeline. You'll explore core challenges at each pipeline stage, from data acquisition and representation to real-time inference and feedback loop retraining. Drawing on their experience building scalable and production-ready graph learning pipelines, the authors take you through the process of building robust graph learning systems in a world of dynamic and evolving graphs. Understand the importance of graph learning for boosting enterprise-grade applications Navigate the challenges surrounding the development and deployment of enterprise-ready graph learning and inference pipelines Use traditional and advanced graph learning techniques to tackle graph use cases Use and contribute to PyGraf, an open source graph learning library, to help embed best practices while building graph applications Design and implement a graph learning algorithm using publicly available and syntactic data Apply privacy-preserving techniques to the graph learning process

gcn training parameters: [Machine Learning and Knowledge Discovery in Databases. Applied Data Science Track](#) Yuxiao Dong, Nicolas Kourtellis, Barbara Hammer, Jose A. Lozano, 2021-09-09 The multi-volume set LNAI 12975 until 12979 constitutes the refereed proceedings of the European Conference on Machine Learning and Knowledge Discovery in Databases, ECML PKDD 2021, which was held during September 13-17, 2021. The conference was originally planned to take place in Bilbao, Spain, but changed to an online event due to the COVID-19 pandemic. The 210 full papers presented in these proceedings were carefully reviewed and selected from a total of 869 submissions. The volumes are organized in topical sections as follows: Research Track: Part I: Online learning; reinforcement learning; time series, streams, and sequence models; transfer and multi-task learning; semi-supervised and few-shot learning; learning algorithms and applications. Part II: Generative models; algorithms and learning theory; graphs and networks; interpretation, explainability, transparency, safety. Part III: Generative models; search and optimization; supervised learning; text mining and natural language processing; image processing, computer vision and visual analytics. Applied Data Science Track: Part IV: Anomaly detection and malware; spatio-temporal data; e-commerce and finance; healthcare and medical applications (including Covid); mobility and transportation. Part V: Automating machine learning, optimization, and feature engineering; machine learning based simulations and knowledge discovery; recommender systems and behavior modeling; natural language processing; remote sensing, image and video processing; social media.

gcn training parameters: *Advanced Data Mining and Applications* Weitong Chen, Lina Yao, Taotao Cai, Shirui Pan, Tao Shen, Xue Li, 2022-11-23 The two-volume set LNAI 13725 and 13726 constitutes the proceedings of the 18th International Conference on Advanced Data Mining and Applications, ADMA 2022, which took place in Brisbane, Queensland, Australia, in November 2022. The 72 papers presented in the proceedings were carefully reviewed and selected from 198 submissions. The contributions were organized in topical sections as follows: Finance and Healthcare; Web and IoT Applications; On-device Application; Other Applications; Pattern Mining; Graph Mining; Text Mining; Image, Multimedia and Time Series Data Mining; Classification, Clustering and Recommendation; Multi-objective, Optimization, Augmentation, and Database; and Others.

gcn training parameters: Machine Learning and Knowledge Discovery in Databases Frank Hutter, Kristian Kersting, Jefrey Lijffijt, Isabel Valera, 2021-02-24 The 5-volume proceedings, LNAI 12457 until 12461 constitutes the refereed proceedings of the European Conference on Machine Learning and Knowledge Discovery in Databases, ECML PKDD 2020, which was held during September 14-18, 2020. The conference was planned to take place in Ghent, Belgium, but had to change to an online format due to the COVID-19 pandemic. The 232 full papers and 10 demo papers presented in this volume were carefully reviewed and selected for inclusion in the proceedings. The volumes are organized in topical sections as follows: Part I: Pattern Mining; clustering; privacy and fairness; (social) network analysis and computational social science; dimensionality reduction and autoencoders; domain adaptation; sketching, sampling, and binary projections; graphical models and causality; (spatio-) temporal data and recurrent neural networks; collaborative filtering and matrix completion. Part II: deep learning optimization and theory; active learning; adversarial learning; federated learning; Kernel methods and online learning; partial label learning; reinforcement learning; transfer and multi-task learning; Bayesian optimization and few-shot learning. Part III: Combinatorial optimization; large-scale optimization and differential privacy; boosting and ensemble methods; Bayesian methods; architecture of neural networks; graph neural networks; Gaussian processes; computer vision and image processing; natural language processing; bioinformatics. Part IV: applied data science: recommendation; applied data science: anomaly detection; applied data science: Web mining; applied data science: transportation; applied data science: activity recognition; applied data science: hardware and manufacturing; applied data science: spatiotemporal data. Part V: applied data science: social good; applied data science: healthcare; applied data science: e-commerce and finance; applied data science: computational social science; applied data science: sports; demo track.

gcn training parameters: *Simulation Tools and Techniques* Houbing Song, Dingde Jiang, 2021-04-26 This two-volume set constitutes the refereed post-conference proceedings of the 12th International Conference on Simulation Tools and Techniques, SIMUTools 2020, held in Guiyang, China, in August 2020. Due to COVID-19 pandemic the conference was held virtually. The 125 revised full papers were carefully selected from 354 submissions. The papers focus on simulation methods, simulation techniques, simulation software, simulation performance, modeling formalisms, simulation verification and widely used frameworks.

gcn training parameters: **Database Systems for Advanced Applications** Xin Wang, Maria Luisa Sapino, Wook-Shin Han, Amr El Abbadi, Gill Dobbie, Zhiyong Feng, Yingxiao Shao, Hongzhi Yin, 2023-04-13 The four-volume set LNCS 13943, 13944, 13945 and 13946 constitutes the proceedings of the 28th International Conference on Database Systems for Advanced Applications, DASFAA 2023, held in April 2023 in Tianjin, China. The total of 125 full papers, along with 66 short papers, are presented together in this four-volume set was carefully reviewed and selected from 652 submissions. Additionally, 15 industrial papers, 15 demo papers and 4 PhD consortium papers are included. The conference presents papers on subjects such as model, graph, learning, performance, knowledge, time, recommendation, representation, attention, prediction, and network.

gcn training parameters: **Machine Learning Applications in Civil Engineering** Yasmin Murad, Husam Abu Hajar, Iftikhar Azim, 2022-12-16

gcn training parameters: **Document Analysis and Recognition - ICDAR 2023** Gernot A. Fink, Rajiv Jain, Koichi Kise, Richard Zanibbi, 2023-08-18 This six-volume set of LNCS 14187, 14188, 14189, 14190, 14191 and 14192 constitutes the refereed proceedings of the 17th International Conference on Document Analysis and Recognition, ICDAR 2021, held in San José, CA, USA, in August 2023. The 53 full papers were carefully reviewed and selected from 316 submissions, and are presented with 101 poster presentations. The papers are organized into the following topical sections: Graphics Recognition, Frontiers in Handwriting Recognition, Document Analysis and Recognition.

gcn training parameters: Advances in Intelligent Data Analysis XXI Bruno Crémilleux, Sibylle Hess, Siegfried Nijssen, 2023-03-31 This book constitutes the proceedings of the 21st International

Symposium on Intelligent Data Analysis, IDA 2022, which was held in Louvain-la-Neuve, Belgium, during April 12-14, 2023. The 38 papers included in this book were carefully reviewed and selected from 91 submissions. IDA is an international symposium presenting advances in the intelligent analysis of data. Distinguishing characteristics of IDA are its focus on novel, inspiring ideas, its focus on research, and its relatively small scale.

gcn training parameters: Mathematical Models Using Artificial Intelligence for Surveillance Systems Padmesh Tripathi, Mritunjay Rai, Nitendra Kumar, Santosh Kumar, 2024-09-18 This book gives comprehensive insights into the application of AI, machine learning, and deep learning in developing efficient and optimal surveillance systems for both indoor and outdoor environments, addressing the evolving security challenges in public and private spaces. Mathematical Models Using Artificial Intelligence for Surveillance Systems aims to collect and publish basic principles, algorithms, protocols, developing trends, and security challenges and their solutions for various indoor and outdoor surveillance applications using artificial intelligence (AI). The book addresses how AI technologies such as machine learning (ML), deep learning (DL), sensors, and other wireless devices could play a vital role in assisting various security agencies. Security and safety are the major concerns for public and private places in every country. Some places need indoor surveillance, some need outdoor surveillance, and, in some places, both are needed. The goal of this book is to provide an efficient and optimal surveillance system using AI, ML, and DL-based image processing. The blend of machine vision technology and AI provides a more efficient surveillance system compared to traditional systems. Leading scholars and industry practitioners are expected to make significant contributions to the chapters. Their deep conversations and knowledge, which are based on references and research, will result in a wonderful book and a valuable source of information.

gcn training parameters: Body Area Networks. Smart IoT and Big Data for Intelligent Health Management Marouan Mizmizi, Maurizio Magarini, Prabhat Kumar Upadhyay, Massimiliano Pierobon, 2024-12-26 This book constitutes the refereed post-conference proceedings from the 18th EAI International Conference on Body Area Networks, BODYNETS 2024-A, held in Milan, Italy, in February 5-6, 2024. The 20 full papers presented here were carefully reviewed and selected from 48 submissions. These papers have been organized in the following topical sections: Implantable devices and In-body communication; Body area networks and transmission technologies; Smart healthcare applications; Privacy and security in wireless body area networks.

gcn training parameters: ECAI 2023 K. Gal, A. Nowé, G.J. Nalepa, 2023-10-18 Artificial intelligence, or AI, now affects the day-to-day life of almost everyone on the planet, and continues to be a perennial hot topic in the news. This book presents the proceedings of ECAI 2023, the 26th European Conference on Artificial Intelligence, and of PAIS 2023, the 12th Conference on Prestigious Applications of Intelligent Systems, held from 30 September to 4 October 2023 and on 3 October 2023 respectively in Kraków, Poland. Since 1974, ECAI has been the premier venue for presenting AI research in Europe, and this annual conference has become the place for researchers and practitioners of AI to discuss the latest trends and challenges in all subfields of AI, and to demonstrate innovative applications and uses of advanced AI technology. ECAI 2023 received 1896 submissions – a record number – of which 1691 were retained for review, ultimately resulting in an acceptance rate of 23%. The 390 papers included here, cover topics including machine learning, natural language processing, multi agent systems, and vision and knowledge representation and reasoning. PAIS 2023 received 17 submissions, of which 10 were accepted after a rigorous review process. Those 10 papers cover topics ranging from fostering better working environments, behavior modeling and citizen science to large language models and neuro-symbolic applications, and are also included here. Presenting a comprehensive overview of current research and developments in AI, the book will be of interest to all those working in the field.

gcn training parameters: Computational Data and Social Networks Minh Hoàng Hà, Xingquan Zhu, My T. Thai, 2024-02-28 This book constitutes the refereed conference proceedings of the 12th International Conference on Computational Data and Social Networks, CSoNet 2023, held in Hanoi, Vietnam, in December 2023. The 23 full papers and 14 short papers presented in this book

were carefully reviewed and selected from 64 submissions. The papers are divided into the following topical sections: machine learning and prediction; optimization; security and blockchain; and network analysis.

gcn training parameters: *Proceedings of the 6th International Conference on Intelligent Computing (ICIC-6 2023)* Ambeth Kumar Visvam Devadoss, Malathi Subramanian, Valentina Emilia Balas, Fadi Al Turjman, Ramakrishnan Malaichamy, 2023-10-16 This is an open access book. PECTEAM, being held for a period of two days, aims to witness the development of technologies in all technical and management domains. The major event in the conference is paper presentations on the latest advances in Engineering and Management disciplines from National and International academic sectors. Special emphasis is given to update newer technologies by Keynote speakers. PECTEAM is a premier platform for researchers and industry practitioners to share their new and innovative ideas, original research findings and practical development experiences in Engineering and Management through high quality peer reviewed papers.

gcn training parameters: *Computer Vision – ECCV 2018* Vittorio Ferrari, Martial Hebert, Cristian Sminchisescu, Yair Weiss, 2018-10-06 The sixteen-volume set comprising the LNCS volumes 11205-11220 constitutes the refereed proceedings of the 15th European Conference on Computer Vision, ECCV 2018, held in Munich, Germany, in September 2018. The 776 revised papers presented were carefully reviewed and selected from 2439 submissions. The papers are organized in topical sections on learning for vision; computational photography; human analysis; human sensing; stereo and reconstruction; optimization; matching and recognition; video attention; and poster sessions.

gcn training parameters: *Algorithms and Architectures for Parallel Processing* Zahir Tari, Keqiu Li, Hongyi Wu, 2024-02-29 The 7-volume set LNCS 14487-14493 constitutes the proceedings of the 23rd International Conference on Algorithms and Architectures for Parallel Processing, ICA3PP 2023, which took place in Tianjin, China, during October, 2023. The 145 full papers included in this book were carefully reviewed and selected from 439 submissions. ICA3PP covers many dimensions of parallel algorithms and architectures; encompassing fundamental theoretical approaches; practical experimental projects; and commercial components and systems.

gcn training parameters: *Computational Data and Social Networks* David Mohaisen, Ruoming Jin, 2021-12-03 This book constitutes the refereed proceedings of the 10th International Conference on Computational Data and Social Networks, CSoNet 2021, which was held online during November 15-17, 2021. The conference was initially planned to take place in Montreal, Quebec, Canada, but changed to an online event due to the COVID-19 pandemic. The 24 full and 8 short papers included in this book were carefully reviewed and selected from 57 submissions. They were organized in topical sections as follows: Combinatorial optimization and learning; deep learning and applications to complex and social systems; measurements of insight from data; complex networks analytics; special track on fact-checking, fake news and malware detection in online social networks; and special track on information spread in social and data networks.

gcn training parameters: *Advances in Data Science* Cristina Garcia-Cardona, Harlin Lee, 2025-09-26 This volume features recent advances in data science ranging from algebraic geometry used for existence and uniqueness proofs of low rank approximations for tensor data, to category theory used for natural language processing applications, to approximation and optimization frameworks developed for convergence and robustness guarantees for deep neural networks. It provides ideas, methods, and tools developed in inherently interdisciplinary research problems requiring mathematics, computer science and data domain expertise. It also presents original results tackling real-world problems with immediate applications in industry and government. Contributions are based on the third Women in Data Science and Mathematics (WiSDM) Research collaboration Workshop that took place between August 7 and August 11, 2023 at the Institute for Pure & Applied Mathematics (IPAM) in Los Angeles, California, US. The submissions from the workshop and related groups constitute a valuable source for readers who are interested in mathematically-founded approaches to modeling data for exploration, understanding and prediction.

gcn training parameters: *Aquaculture Environment Regulation and System Engineering*

Ce Shi, Zhangying Ye, Dibo Liu, 2023-11-02

gcn training parameters: Neural Information Processing Teddy Mantoro, Minho Lee, Media Anugerah Ayu, Kok Wai Wong, Achmad Nizar Hidayanto, 2021-12-06 The two-volume set CCIS 1516 and 1517 constitutes thoroughly refereed short papers presented at the 28th International Conference on Neural Information Processing, ICONIP 2021, held in Sanur, Bali, Indonesia, in December 2021.* The volume also presents papers from the workshop on Artificial Intelligence and Cyber Security, held during the ICONIP 2021. The 176 short and workshop papers presented in this volume were carefully reviewed and selected for publication out of 1093 submissions. The papers are organized in topical sections as follows: theory and algorithms; AI and cybersecurity; cognitive neurosciences; human centred computing; advances in deep and shallow machine learning algorithms for biomedical data and imaging; reliable, robust, and secure machine learning algorithms; theory and applications of natural computing paradigms; applications. * The conference was held virtually due to the COVID-19 pandemic.
