the cost of survival summary: Network Meta-Analysis for Decision-Making Sofia Dias, A. E. Ades, Nicky J. Welton, Jeroen P. Jansen, Alexander J. Sutton, 2018-01-08 A practical guide to

network meta-analysis with examples and code In the evaluation of healthcare, rigorous methods of quantitative assessment are necessary to establish which interventions are effective and cost-effective. Often a single study will not provide the answers and it is desirable to synthesise evidence from multiple sources, usually randomised controlled trials. This book takes an approach to evidence synthesis that is specifically intended for decision making when there are two or more treatment alternatives being evaluated, and assumes that the purpose of every synthesis is to answer the question for this pre-identified population of patients, which treatment is 'best'? A comprehensive, coherent framework for network meta-analysis (mixed treatment comparisons) is adopted and estimated using Bayesian Markov Chain Monte Carlo methods implemented in the freely available software WinBUGS. Each chapter contains worked examples, exercises, solutions and code that may be adapted by readers to apply to their own analyses. This book can be used as an introduction to evidence synthesis and network meta-analysis, its key properties and policy implications. Examples and advanced methods are also presented for the more experienced reader. Methods used throughout this book can be applied consistently: model critique and checking for evidence consistency are emphasised. Methods are based on technical support documents produced for NICE Decision Support Unit, which support the NICE Methods of Technology Appraisal. Code presented is also the basis for the code used by the ISPOR Task Force on Indirect Comparisons. Includes extensive carefully worked examples, with thorough explanations of how to set out data for use in WinBUGS and how to interpret the output. Network Meta-Analysis for Decision Making will be of interest to decision makers, medical statisticians, health economists, and anyone involved in Health Technology Assessment including the pharmaceutical industry.

The book demonstrates how to create a budget-impact analysis using a simple six-step process that is consistent with current guidelines for these analyses. Examples and exercises for each chapter afford an opportunity to practice the six-step process in practical applications. The book progresses from a framework for budget impact analyses to an in-depth review of components and how to develop and present these in software applications and reports. Critical considerations such as uncertainty analysis and validation, and considerations for alternate interventions, such as vaccines and diagnostics, are also covered. This book is a “must have” for the builder and budget holder, with builders benefiting from instructions to identify and estimate all necessary variables and budget holders receiving a guide to what should be included in the analyses they assess.

the cost of survival summary: *Stereotactic Radiosurgery and Stereotactic Body Radiation Therapy* Daniel M. Trifiletti, Samuel T. Chao, Arjun Sahgal, Jason P. Sheehan, 2019-06-27 This book is a comprehensive review of stereotactic radiosurgery (SRS) and stereotactic body radiation therapy (SBRT): its physics, clinical evidence, indications, and future directions. The utilization of stereotactic radiosurgery (SRS) and stereotactic body radiation therapy (SBRT) is increasing internationally because of several factors. First, it offers patients a local treatment option that has demonstrated effectiveness similar to traditional surgery without the morbidity of general anesthesia and open surgical resection. Second, recent advancements in the quality of scientific evidence supporting a SRS or SBRT-containing approach in patients continues to evolve and demonstrate favorable disease-specific outcomes with little, if any, toxicity in various anatomic disease sites and for various conditions including cancer, benign tumors, and other psychiatric and neurologic conditions. Third, and most provocatively, is the notion that definitive local therapy (i.e. SRS or SBRT) in patients with cancer can boost the immune system to fight cancer in other sites throughout the body. While traditional medical knowledge would suggest that all patients with metastatic cancer are incurable, there is a mounting body of evidence that there is a subset of these patients that can be cured with definitive SRS or SBRT. This volume thus delves into each of these benefits and aspects of treatment, guiding physicians to the best treatment plan for their patients. Expert, international authors provide guidelines for SRS and SBRT use by clinicians. Chapters are divided into six main sections: Radiobiology of Radiosurgery and Stereotactic Body Radiation Therapy, Intracranial Radiosurgery Technique, Intracranial Radiosurgery by Indication, Stereotactic Body Radiation Therapy Technique, Stereotactic Body Radiation Therapy by Indication, The Future of Radiosurgery and SBRT. Overall physics are explained, as well as specific considerations for particular surgical tools (including the Leksell Gamma Knife and Accuray CyberKnife), techniques (including fractionated and charged particle radiosurgery), and anatomic sites (including brain metastases, pituitary tumors, and the prostate). Detailed images and charts enhance the chapters. This book provides physicians with a single, practical resource incorporating both of these broad categories of treatment, SRS and SBRT, and better defines the current role and the direction of radiosurgery.

the cost of survival summary: Competitive Business Strategy for Teaching Hospitals James Langabeer, John Napiewocki, 2000-08-30 Without new ways to think and manage itself strategically, academic healthcare faces terminal deterioration. Heightened competition and changing dynamics have brought turbulence to teaching hospitals, and the main impact has been financial. Langabeer and Napiewocki give health care executives the tools and concepts of strategic management they need and ways to strengthen analytic skills, all based on up-to-date empirical research, cast in language they can grasp and relate to, and specially tailored to help teaching hospital administrators cope successfully with today's marketplace challenges. Board members, trustees, and others with decision- and policy-making responsibilities will also find the book essential, as well as their teaching colleagues and students on their way up in the hospital industry. The authors maintain that if nonprofit teaching hospitals are to compete successfully with private for-profit hospital chains, not only must they learn the terrain of the playing fields, they must also learn how the game itself is played. Langabeer and Napiewocki offer that knowledge, and in doing so have written the first book of its kind to address comprehensively the entire realm of strategic management aimed clearly at teaching hospitals and major academic medical centers. With findings from primary empirical research into a large sample of teaching hospitals and focusing on the statistical relationships to economic performance, they provide crucial insights into why certain hospitals are more effective than others. Their book will also help healthcare executives relate strategy research on industrial organizations to their own teaching hospital environments. In doing so, their book fills a void in the literature on business strategy that for too long has caused consternation among healthcare administrators and aspirants alike.
