**iready math workbooks:** *Do Special Education Students Use of Interactive Materials, Specifically the I-Ready Program, Compared to Other Worksheets Increase Student Motivation in Mathematics?* Christine Maryanna Hartwich, 2018 The purpose of this study was to see how elementary special education students do on computer activities versus worksheets, in terms of accuracy, on-task behavior, and motivation. This researcher believed students would enjoy learning a specific mathematics skill more on the computer using a rating scale after the activity compared to the pencil and paper lesson, and that students would be on-task more often during the computer components. This researcher observed and recorded assignment completion times, recorded off-task behavior, and interviewed students on their engagement in the two methods. This researcher wanted to see if the computer aides increased student motivation in mathematics and whether the scores on assessments are higher than the worksheets. Participants included eight students from one classroom. Students' mathematics rotations (and hence the time for each math block on worksheets or computer) per the school model include twenty minutes with the teacher, twenty minutes with the teacher assistant, twenty minutes in an independent cubby and twenty minutes on a school-based computerized program. Part of this study allowed this researcher to increase the computer time freely. Findings also showed students were more motivated by the computer and completed more worksheet rotations when the computer time was increased. However, half of the students increased their working motivation when the computer time was increased. Eighty-three percent of students preferred learning on the computer post assessments on average for all their topics. In all the observational anecdotal data, including the increase in computer lessons, 30 instances of off-task behavior occurred during teacher pencil and paper lessons, 94 instances occurred during the computer lessons, and four were unspecified. Students were off-task an average of 23.5 times in one computer block meaning they were off-task more during the teacher worksheet rotation. This included prompts, warnings, and minuses (three reminders before timeouts) and did

not include timeouts, refusals (minused out) or self-reflections. Timeouts are results of displaying inappropriate behavior. Self-reflection is a voluntary coping skill break, up to six minutes, and students are not penalized. Off-task criteria also included students going on different assignments and other inappropriate behavior such as arguing. Note: not all behavior was included.

Hall, 2019 This study was designed to determine what change the i-Ready math tutorial videos had on math performance, self-efficacy, and math anxiety with middle school math students. In addition, the study determined the student perception of the effectiveness of the i-Ready math tutorial videos. The purpose was to help educators identify a specific tool that would raise student's math performance, self-efficacy, and decrease the student's math anxiety. The following measurements were used in this study Renaissance STAR Math, i-Ready pre- and posttest, Mathematics Self-Efficacy and Anxiety Survey, and a student perception survey were used in this study. The overall sample population included both seventh and eighth graders showed significant difference among the Renaissance STAR Math screeners, but no significant difference in the students' self-efficacy and anxiety. However, the study found the spring cohort showed the most gains in their math self-efficacy and decline in their math anxiety. It is proposed that computer-assisted technology can have an impact on student learning outcomes, self-efficacy, and anxiety.
