ichthyology textbooks: Darwin's Fishes Daniel Pauly, 2007-08-27 In *Darwin's Fishes*, Daniel Pauly presents an encyclopaedia of ichthyology, ecology and evolution, based upon everything that Charles Darwin ever wrote about fish. Entries are arranged alphabetically and can be about, for example, a particular fish taxon, an anatomical part, a chemical substance, a scientist, a place, or an evolutionary or ecological concept. The reader can start wherever they like and are then led by a series of cross-references on a fascinating voyage of interconnected entries, each indirectly or directly connected with original writings from Darwin himself. Along the way, the reader is offered interpretation of the historical material put in the context of both Darwin's time and that of contemporary biology and ecology. This book is intended for anyone interested in fishes, the work of Charles Darwin, evolutionary biology and ecology, and natural history in general.

ichthyology textbooks: Ichthyology Karl Frank Lagler, John E. Bardach, 1962 This new and comprehensive treatment of the field of ichthyology, the first American effort in more than half a century, is intended as an introduction to the subject. It covers virtually every aspect of the science of fishes: how they are built; how they function; how they react to one another and to their environment; what principles govern their distribution; how characteristics are passed from parents to offspring; how they are classified, and how diverse and numerous they are; how they have evolved; and how they reproduce, feed, and grow. Considerable effort has been made by the authors to render *Ichthyology* useful to the reader lacking in the technical background. Scientific words are defined and scientific names of fishes are used throughout only in conjunction with English names. A large number of illustrations, many by the well known scientific illustrator, William Brudon, are included to help clarify the text -- Book Jacket.

ichthyology textbooks: A Catechism of Ichthyology William Pinnock, 2015-08-05 Excerpt from *A Catechism of Ichthyology: Being a Familiar Introduction to the Natural History of Fishes, Scientifically Arranged* Q. By what means are the bodies of fish secured from the macerating influence of the water? A. Besides a strong scaly covering with which many species are furnished, they are protected from the influence of the waters by a glutinous matter, which is an effectual preservative against the ill effects which might otherwise arise from the element in which they dwell. Q. Do fish possess the external senses in perfection? A. It is impossible to answer this question with certainty; but it is probable that their scaly covering renders their sense of touching very imperfect; that from their hard bony palate, they can have but little delicacy of taste; the density of the fluid in which they live must render their sense of smelling not very acute; and it is very doubtful whether they hear at all. Q. Is not their sight very quick? A. Their sight is supposed to be quick, but, from the structure of the eye, there is reason to believe that their powers of vision do not enable them to discern objects at a considerable distance.
